

BAM GHL Agent

State of the Project

Where we are with the white-labeled GoHighLevel agency stack: what we're building, the front ends and back ends in flight, the integrations that are wired, and the work in front of us.

Author	Zoran Savic
Date	2026-04-24
Repo	bam-os-requirements / bam-ghl-agent
Supabase project	jnojmfmpnsfntqmwhopz (By Any Means Basketball Pro)
Active clients seeded	20 in clients table
Integrations	10 (Supabase, Anthropic, Asana, Google OAuth, GCal, GSheets, GHL, Notion, Slack, Stripe)

1. Executive summary

BAM Business is a white-labeled GoHighLevel agency that runs CRM, automations, websites, funnels, pipelines, and communications for sports academies (and eventually home services companies). Each client lives in their own GHL sub-account; BAM staff operate them centrally.

This project is the operating system around that service. It does three things, and it is on a path toward a fourth.

- **Onboard** new academies through self-serve forms (class setup, offer setup, parent onboarding).
- **Triage** ongoing support tickets from active clients (Error / Change / Build) through a customer support portal.
- **Operate** all of it from one staff dashboard (bam-portal) that pulls from the 10 integrations.

North star

One portal serving both clients and staff. Not just an internal tool, and not just a support form — a real two-sided product.

- **Clients can:** chat with staff in dedicated per-topic chat windows; see every ad campaign they're running and adjust their own ad spend; submit support tickets and check the status of their systems.
- **Staff can:** operate every client account from one dashboard (the existing bam-portal), with an autonomous GHL agent that eventually drafts fixes and builds for staff to review before shipping.

The autonomous agent is a *capability* inside the staff side of the portal. The portal itself is the destination.

Where we are right now. The customer-facing HTML is the most mature surface — onboarding and the support portal are functional and Supabase-backed. The staff portal (bam-portal) was built by Cole and is in the middle of being reconnected to Zoran's own backend keys: Supabase and Slack are live; GHL, Stripe, Asana, Google, Notion are wired but the data joins are not yet bound to a stable client roster. We just created and seeded the **clients** table (20 rows) so every integration ID has one place to hang from.

2. Architecture at a glance

Two portals, one shared backend. Customer-facing HTML files write into Supabase; the staff React app reads from Supabase plus the 10 integrations.

Two portals

- **Customer-facing** — plain HTML, no build step. Onboarding flow (class-setup → offer-setup → parent-onboarding) and support portal (client-portal.html). Lives at /Users/zoransavic/bam-ghl-agent/ (local working copy) and ships into GHL embeds.
- **Staff-facing** — bam-portal/, React 19 + Vite 8 + React Router 7 with Vercel serverless functions in /api/. Deployed to Vercel; SSO-protected. Built by Cole; Zoran is reconnecting backend with his own keys.

Shared backend

- **Supabase** (jnojmfmpnsfmtqmwhopz) — Questions DB (202 rows, source of truth for all form questions), user_slack_tokens (per-user OAuth), clients (20 rows, integration ID join table).
- **Vercel serverless functions** — one route per integration in bam-portal/api/.
- **Notion** — knowledge base for SOPs, build guides, template sections (will migrate to Supabase later).

Data flow (target)

Client submits form → write to Supabase → create Asana ticket → staff sees it in bam-portal → staff (eventually agent + staff) builds the asset → push into client's GHL sub-account.

The two-path setup (important)

- /Users/zoransavic/bam-ghl-agent/ — LOCAL, not in monorepo git. Holds the working customer HTML files, .claude/commands skills, and worktrees.
- /Users/zoransavic/bam-os-requirements/bam-ghl-agent/ — GIT inside the monorepo. Holds CLAUDE.md, bam-portal React app, docs, sections.

Both folders point Supabase MCP at the same project. Open Claude Code on the local path for customer HTML work, on the monorepo path for portal work.

3. Customer-facing front end

HTML files at the local project root. All form questions are pulled from the Supabase Questions DB so a single edit propagates to every page that uses that question.

Onboarding flow (one-time, new academy)

File	Role	Lines	Backend
class-setup.html	Step 1 — class structure, schedule, capacity	776	Supabase
offer-setup.html	Step 2 — pricing, free trial, packages	456	Supabase
parent-onboarding.html	Step 3 — parent / athlete intake	228	Supabase

Support portal (ongoing, existing clients)

client-portal.html is the single entry point for active clients. Three ticket types (Error / Change / Build) and 10 build menu items: Gym Rental, Player Intake, New Hire, Youth Academy, Internal Tournament, Sponsor Inquiry, Camps/Clinics, Upsells, Staff Member, Promo (plus a "Build something else" overflow).

Internal HTML files (status: legacy, confirm before editing)

File	Purpose	Lines
dashboard.html	Internal ops dashboard (pre-bam-portal)	1010
error-ticket-internal.html	Error ticket triage with Claude analysis	1285
change-ticket-internal.html	Change request management	1387
build-mode.html	Dual-panel build workspace with timer	1323
analysis.html	Support ticket intake analytics	836

These files predate the React portal. Likely to be deprecated as bam-portal absorbs their function — but confirm with Zoran before deleting; some are still referenced in workflows.

4. Staff front end (bam-portal)

React 19 + Vite 8 + React Router 7. Deployed to Vercel with SSO protection. The portal is the single pane of glass for staff to operate every client account.

Main views

View	Purpose	Backend dependency
Dashboard	Cross-client overview, alerts, recent activity	clients + Stripe + Asana
ClientsView	Roster of every academy with integration drill-downs	clients (NEW)
LeadsCRMView	Lead pipeline across all GHL sub-accounts	GHL
CommunicationView	Slack + GHL conversations consolidated	Slack + GHL
KnowledgeBaseView	SOPs, build guides, template sections	Notion (broken — needs perms)
FinancialsView	MRR, churn, invoices, dunning	Stripe
UnifiedTasksView	Cross-system task list	Asana + Supabase
CalendarView	Multi-account scheduling	Google Calendar
SettingsView	Per-user integration auth + prefs	Supabase + OAuth providers
SOPView	Standard operating procedures	Notion
ProblemWarehouseView	Pattern library of past tickets + fixes	Supabase
SystemsView	Integration health + key status	All 10
MarketingView	Per-client campaign performance	GHL + Meta (future)
ActionItemsView	Triaged action queue	Supabase + Asana

Training module

Separate React module inside bam-portal for staff training. Views: TrainingHome, AdminHub, QuickFireMode, CalibrationMode, ReviewFeed, AddScenario, TeamDashboard, ScenarioFeedbackView. Used to drill new staff on common ticket scenarios — not on the critical path for the current backend reconnection work.

5. Back end — integrations and state

Each integration has a key configured in Vercel and (mostly) a serverless function in `bam-portal/api/`. Status reflects what is actually returning live data right now, not just what is wired.

Integration	Route	Purpose	Status
Supabase	<code>lib/supabase.js</code>	Main DB + auth, Questions DB, clients	LIVE
Slack	<code>/api/slack/channels.js</code>	Per-user OAuth + comms	LIVE (BAM Portal app, OAuth end-to-end)
Stripe	<code>/api/stripe/overview.js</code>	Payments, MRR, customers, invoices	LIVE (\$17.7k MRR, 56 subs confirmed)
GHL	<code>/api/ghl.js</code>	Sub-account ops via V1 + V2 APIs	LIVE (53 sub-accounts enumerable; 20 mapped)
Asana	<code>/api/asana/tasks.js</code>	Tickets + tasks	Wired (workspace 1201652590043795 confirmed)
Google OAuth	<code>/api/auth/google/*</code>	Staff login + Google service auth	Wired
Google Calendar	<code>/api/calendar/events.js</code>	Multi-account scheduling	Wired (per-user OAuth pending)
Google Sheets	<code>/api/sheets/onboarding.js</code>	Onboarding tracker (legacy)	LIVE — to be replaced by <code>/api/clients.js</code>
Anthropic	<code>/api/ai/search.js</code>	Claude calls for portal AI features	Wired
Notion	<code>/api/notion/query.js</code>	SOPs + KB	Partial (10 SOP pages return metadata, 0 children)

Supabase tables

- **Questions Database** — 202 rows. Single source of truth for every form question across class-setup, offer-setup, parent-onboarding, and the support portal.
- **user_slack_tokens** — per-user Slack OAuth tokens. RLS enabled; users only see their own row.
- **clients** — 20 rows. The new join table that gives every integration ID one home per client.

clients table (just seeded)

Columns: `id`, `name`, `status` (onboarding/active/paused/churned), `ghl_location_id` (unique), `slack_channel_id`, `stripe_customer_id`, `notion_page_id`, `asana_project_id`, `created_at`, `updated_at`. RLS enabled with staff read/insert/update policies; `updated_at` trigger in place.

6. Client roster (current state of the join table)

20 active clients seeded into the clients table. GHL location IDs and Notion page IDs are filled where known. Stripe customer IDs filled for 4 confirmed matches; the rest need owner-name → academy mapping. Slack channel IDs and Asana project IDs are not yet populated for any row.

#	Name	GHL	Notion	Stripe
1	BAM San Jose	✓	✓	—
2	BAM WV (Mountain State)	✓	✓	—
3	BAM NY	✓	✓	—
4	BTG	✓	—	—
5	The Basketball Lab	✓	—	✓ (Jake Russell)
6	Prime By Design	✓	✓	—
7	Pro Bound Training	✓	—	—
8	Danny Cooper Basketball	✓	✓	—
9	Johnson Bball	✓	✓	—
10	D.A. Hoops Academy	✓	✓	—
11	Performance Space Hoops	✓	✓	—
12	Straight Buckets Performance	✓	✓	—
13	Basketball+	✓	✓	—
14	Elite Smart Athletes	✓	✓	—
15	Major Hoops	✓	✓	✓ (Andrew Major)
16	Total Hoops Training (G. Fowler)	✓	✓	✓ (George Fowler)
17	Supreme Hoops Training	✓	✓	—
18	Sage Hoops	✓	✓	—
19	Wyatt Garren	—	✓	✓
20	ACTIV8	—	✓	—

Gaps to close on the roster: 3 clients still need Notion profiles (BTG, Pro Bound Training, The Basketball Lab); 2 don't have GHL sub-accounts wired (Wyatt Garren, ACTIV8); 16 still need Stripe customer IDs matched.

7. Where we are right now

Done in this work cycle

- Verified Supabase MCP points at jnojmfmnpnsfmtqmwhopz and listed all tables.
- Pulled and absorbed the new CLAUDE.md from main.
- Created the clients table from scratch with full RLS + audit trigger (the previous "created empty" note was incorrect; table didn't actually exist).
- Reconciled 3 different client lists (CLAUDE.md original 13, Notion profiles, screenshot) into one canonical roster of 20.
- Resolved name aliases: BAM Mountain State = DETAIL Mountain State = BAM WV; George Fowler = Total Hoops Training.
- Seeded all 20 clients with names, GHL location IDs (where known), and Notion page IDs (where known).
- Bypassed Vercel SSO protection via vercel curl to call deployed Stripe API endpoint.
- Confirmed 4 Stripe customer matches: Total Hoops Training, The Basketball Lab, Major Hoops, Wyatt Garren.

Live and trustworthy

- Customer onboarding flow (3 HTML pages, Supabase-backed).
- Customer support portal (client-portal.html, 10 build menu items).
- Supabase Questions DB (202 rows) as single source of truth for all form questions.
- Slack OAuth (per-user tokens via user_slack_tokens).
- Stripe overview API (\$17.7k MRR confirmed live).
- GHL agency-key access to 53 sub-accounts.

Wired but not yet fully usable

- bam-portal staff app — deployed but most views still read from the legacy Google Sheets onboarding endpoint instead of the new clients table.
- Notion KB — integration is connected but lacks page-level access on most pages (waiting on Cole to make Zoran workspace owner so workspace-wide integration can be enabled).
- Asana — workspace confirmed but per-client project IDs not seeded.
- Google Calendar — server token works; per-user OAuth flow not built.

8. What's next

In order, smallest unblock first.

#	Step	Owner	Unblocks
1	Build /api/clients.js endpoint backed by clients table	Zoran	Replaces Google Sheets dependency in bam-portal
2	Update App.jsx to load clients from the new endpoint	Zoran	Every staff view gets a stable client roster
3	Owner-name → academy mapping from Zoran for remaining 26 Stripe (pma)	Zoran	Matches Stripe customer IDs in clients
4	Backfill stripe_customer_id for the remaining 16 rows	Zoran	Financials view per-client
5	Add Notion profiles for BTG, Pro Bound Training, The Basketball Lab	Zoran	Notion KB completeness
6	Wait on Cole — workspace-wide Notion integration access	Cole	KB / SOP views become usable
7	Fix client name parsing in /api/notion/all_clients (names returned as "?")	Zoran	Notion view accuracy
8	Seed slack_channel_id per client (manual map, then automated)	Zoran	CommunicationView per-client
9	Seed asana_project_id per client	Zoran	Per-client task view
10	Per-user Google Calendar OAuth flow	Zoran	Multi-account scheduling
11	Customer portal → Slack mirroring (Option B for client comms)	Zoran	Inbound from clients into Slack
12	Lock client-portal.html scope; revisit checkpoints/alerts schema for clients	Zoran	Lifecycle alerting

Held off intentionally

- **Lifecycle / alerts columns on clients** — deferred until client-portal.html scope is final, because the portal may handle some onboarding tasks itself, which would change what staff has to track.
- **Asana ticket schema** — same record for onboarding + support, or separate tables? Decision pending.
- **Onboarding entry URL** — how a new academy lands on class-setup.html in the first place. Will be wired up when the sales handoff is defined.
- **Notion** → **Supabase migration** for SOPs, build guides, template sections. Coming after the staff portal stabilizes.

North star (not yet started)

One portal, two sides. Clients log in to chat with staff, see and control their ad campaigns, and check ticket / system status. Staff log in to operate every client account, with an autonomous GHL agent drafting Support Ticket fixes and Onboarding Build outputs for them to review and approve. The agent lives *inside* the staff side; the portal itself is the destination.

9. Risks and open questions

- **Two-path setup confusion** — local working folder vs monorepo path is the single biggest source of "wait, where's that file" friction. Mitigated by the CLAUDE.md callout but worth a sticky reminder.
- **Cole dependency on Notion access** — KB views are dead until Cole flips workspace-wide integration on. No workaround on our side.
- **Stripe customer matching** — billing is under owner names, not academy names. Need Zoran's mapping to finish; can't infer.
- **Legacy HTML files** (dashboard, error-ticket-internal, change-ticket-internal, build-mode, analysis) overlap with bam-portal views. Unclear if still in use; need a deprecation pass.
- **Vercel SSO protection** — needed for security but adds friction to API calls during dev. Workflow established (vercel curl) but worth documenting.
- **Backend reconnection mid-flight** — bam-portal currently has a mix of Cole's keys and Zoran's keys. Until the swap is complete, some endpoints may read from one account and write to another.

Quick reference

Item	Value
Supabase project ref	jnojmfmpnsfmtqmwhopz
GHL agency key	Configured in Vercel (GHL_LOCATIONS_JSON enumerates 13)
Stripe account	mike@byanymeanstball.com — \$17.7k MRR, 56 subs
Slack app	BAM Portal — Client ID 9371199551328.10970298548951
Asana workspace	GID 1201652590043795
Notion KB root	https://www.notion.so/33a5aca8ac0f81f38881d3f7003294ec
bam-portal repo path	/Users/zoransavic/bam-os-requirements/bam-ghl-agent/bam-portal/
Customer HTML path	/Users/zoransavic/bam-ghl-agent/
